

Assumptions For ChronoTimer Project - Spring 1:

We are parsing the time as HH:MM:SS.HUNDREDTHS and will use that time for our calculations rather than using a running timer to do our time calculations.

Event IND is setting the type of event creating a new event. A new event is created when the system is powered on.

System only enters default state at first power up or after reset.

Data is stored until system is reset, not when system is powered off.

Adding a runner to the queue
